Food Delivery App – Project Summary

1. Project Overview

Food Delivery is a full-scale, cloud-based food delivery platform designed specifically for the Middle East market. The system is built to support the complete food delivery ecosystem through four interconnected applications:

- **Customer Mobile Application** (iOS & Android)
- **Restaurant Mobile Application** (iOS & Android)
- **Driver Mobile Application** (iOS & Android)
- **Admin Web Dashboard**

The platform addresses regional requirements such as multilingual support (Arabic – RTL, Kurdish, English), local payment integrations, cultural UX considerations, and infrastructure optimized for Middle East latency. The solution is architected for scalability, reliability, and real-time performance to support rapid growth in Arab's digital economy.

---

2. Business Goals & Objectives

2.1 Strategic Objectives

- Establish a reliable, localized food delivery ecosystem
- Enable seamless interaction between customers, restaurants, drivers, and administrators
- Support high transaction volumes with real-time tracking and notifications
- Provide a scalable foundation for future expansion

2.2 Functional Objectives

Customer Application

- Restaurant discovery with search, filters, and recommendations
- Seamless ordering, checkout, and payment experience
- Real-time order tracking with live driver location
- Reviews, ratings, order history, loyalty, and in-app wallet

Restaurant Application

- Order acceptance, rejection, and preparation management
- Editing existing menu items, pricing, and availability
- Sales analytics, revenue tracking, and promotions
- Communication with drivers and admin support

Driver Application

- Real-time order requests and acceptance
- GPS navigation and optimized routing
- Earnings tracking and performance metrics
- Safety features including SOS and documentation management

Admin Dashboard

- Full control over users, restaurants, drivers, and orders
- Financial management, commissions, and settlements
- Advanced analytics, reporting, and platform configuration
- Customer support, issue resolution, and system monitoring

---

3. Technical Architecture Summary

3.1 High-Level Architecture

The platform follows a **cloud-native microservices architecture** with clear separation of concerns. Each service can scale independently based on demand.

Core Technology Stack:

- **Frontend (Mobile):** Flutter (iOS & Android)
- **Frontend (Web):** React.js with TypeScript
- **Backend:** Node.js (Express.js)
- **Database:** PostgreSQL
- **Caching:** Redis
- **Search:** Elasticsearch
- **Real-Time Communication:** WebSockets
- **Cloud Services:** CDN, Load Balancer, Object Storage

3.2 Infrastructure Highlights

- API Gateway with authentication, rate limiting, and routing
- Scalable cloud deployment with auto-scaling
- Secure private networking for databases and caches
- Backup, disaster recovery, and monitoring enabled

---

4. Core System Modules

4.1 Backend Microservices

- Authentication & User Management
- Order Management
- Restaurant & Menu Services
- Driver & Delivery Management
- Payment & Wallet Service
- Notification & Real-Time Events
- Analytics & Audit Logging

4.2 Data Management

- **PostgreSQL:** Transactional data (orders, users, payments)
- **Redis:** Sessions, caching, real-time status
- **Elasticsearch:** Fast restaurant and menu search

---

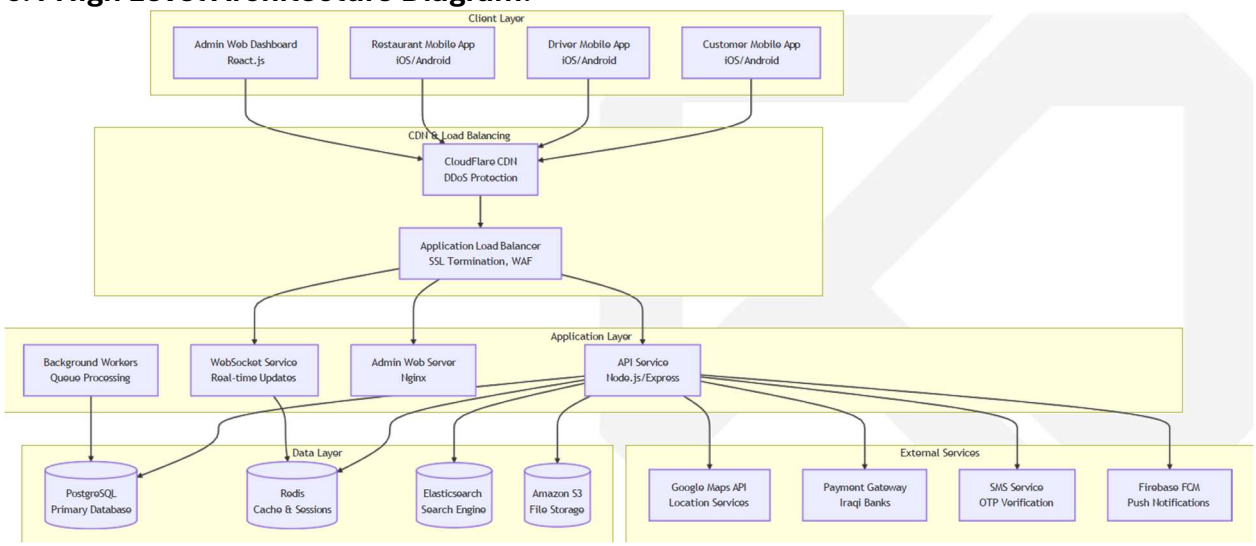
5. Design & User Experience Overview

- Mobile-first, intuitive UI with cultural sensitivity
- Full Right-to-Left (RTL) support for Arabic
- Consistent design system across all applications
- Responsive layouts for mobile, tablet, and desktop
- Optimized loading states, error handling, and micro-interactions

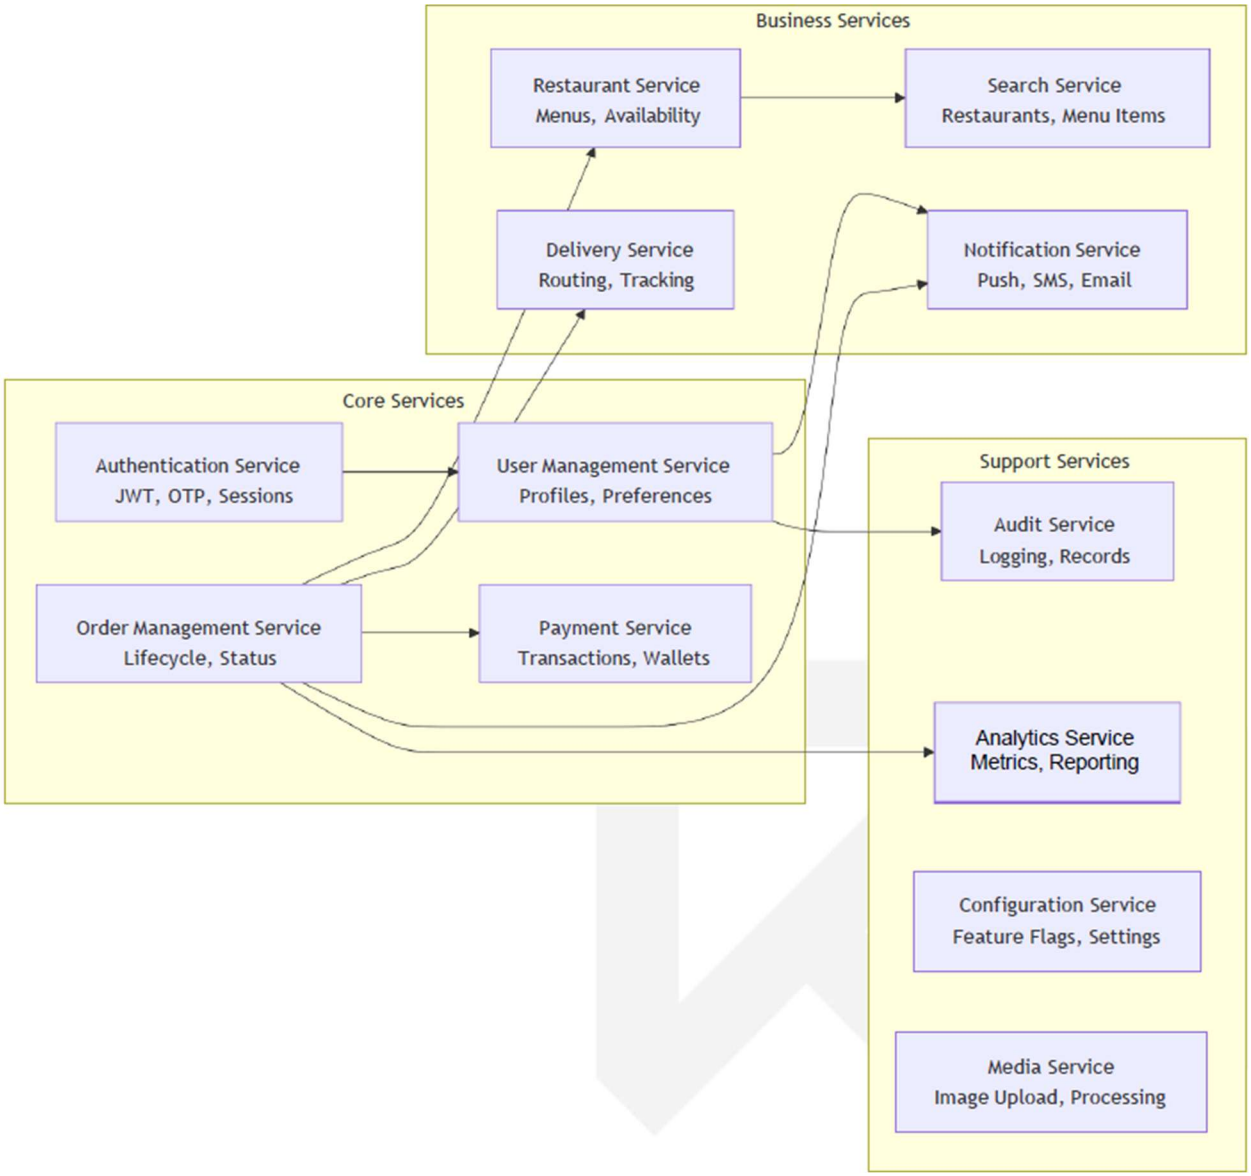
---

6. Key Process Flow Charts

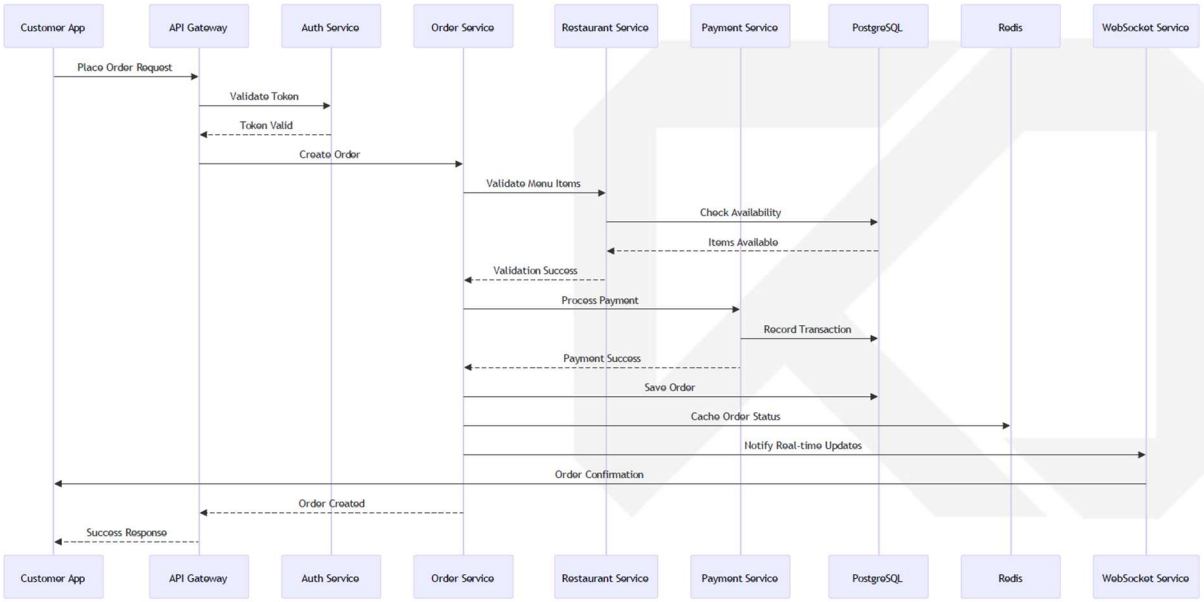
6.1 High Level Architecture Diagram:



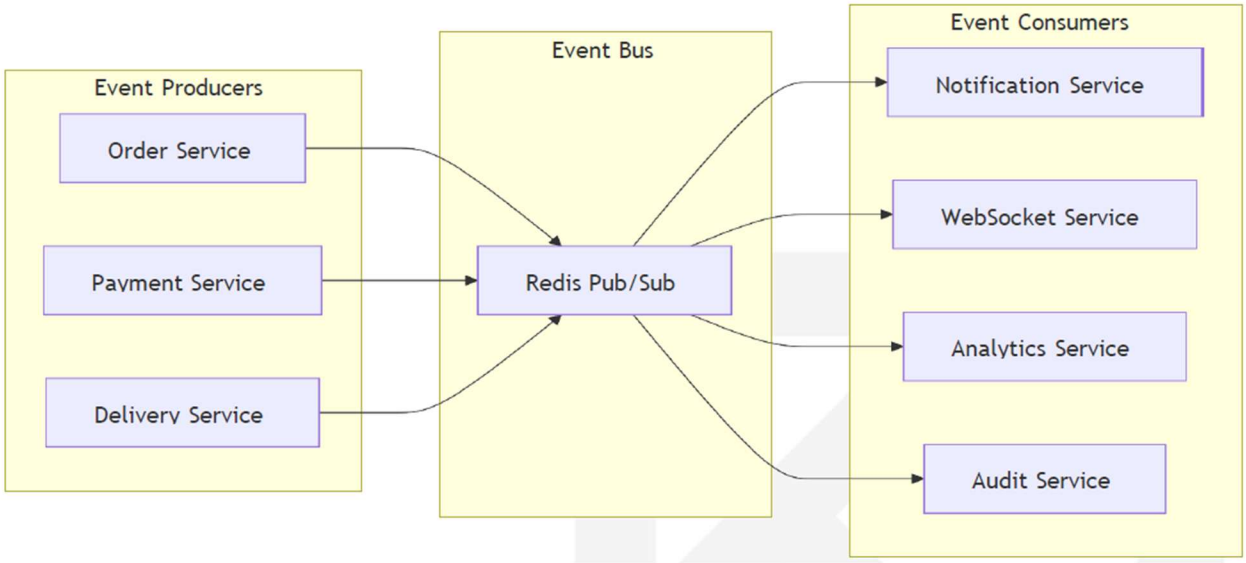
6.2 Microservices BreakDown



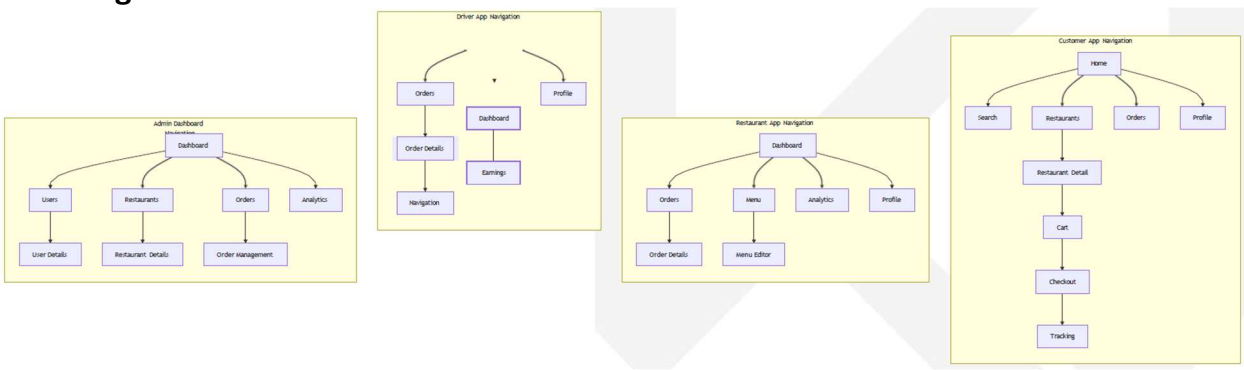
6.3 Data Flow Architecture



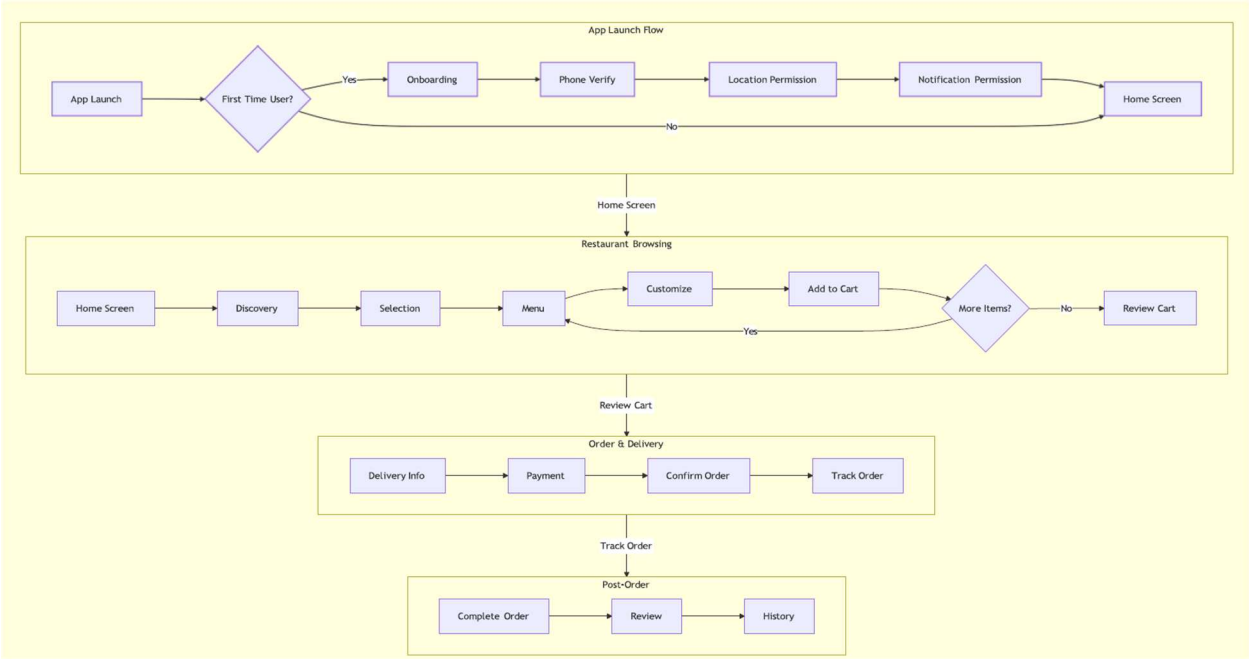
6.4 Event Driven Architecture



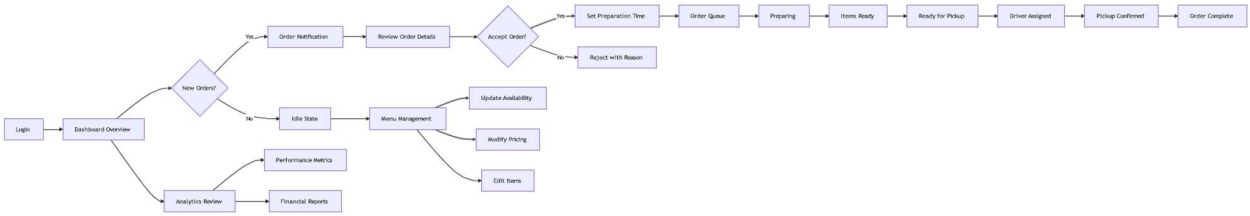
6.5 Navigation Panels



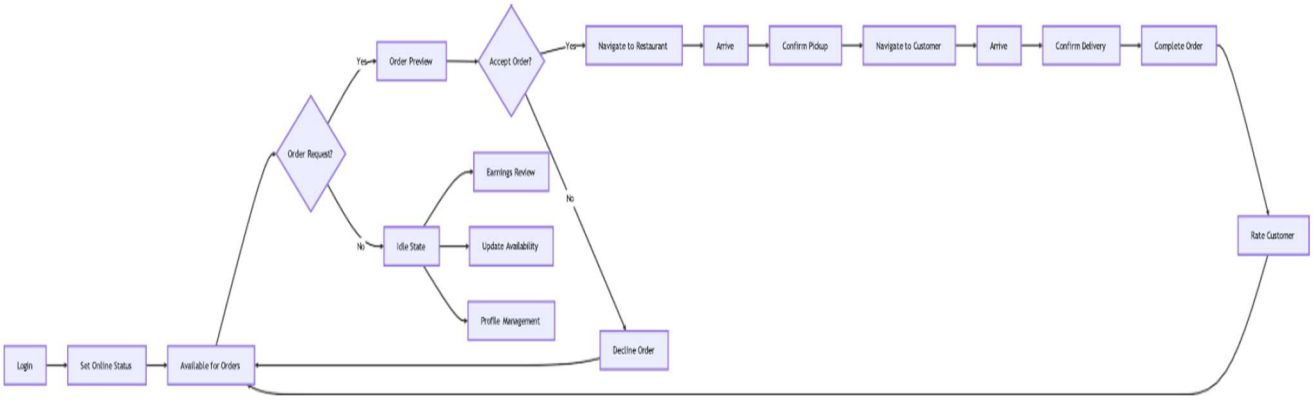
6.6 Customer Application Flow



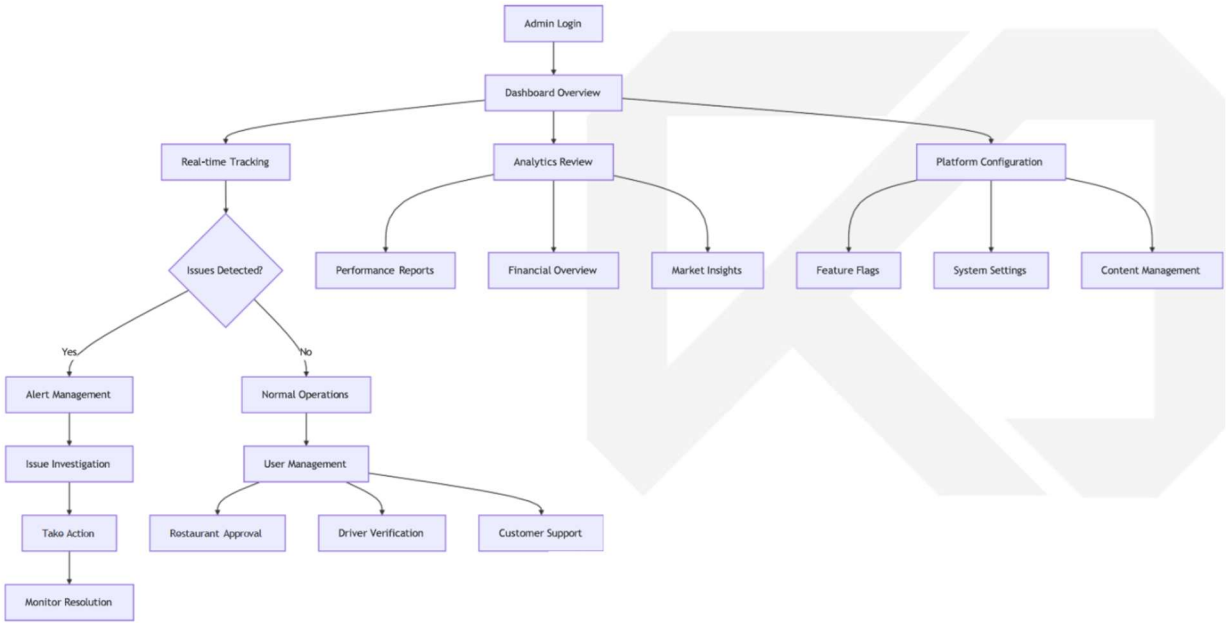
6.7 Restaurant Application Flow



6.8 Driver Application Flow



6.9 Admin Dashboard Flow



---

7. Security, Deployment & Operations

JWT-based authentication and role-based access control

- Secure API gateway with rate limiting
- CI/CD pipeline for controlled releases
- Monitoring, logging, and alerting
- Backup and disaster recovery strategy

---

8. Conclusion

The Food Delivery platform is a robust, enterprise-grade solution tailored for the Middle East market. Its modular architecture, localized user experience, real-time capabilities, and strong administrative control provide a solid foundation for sustainable growth, operational efficiency, and future scalability. The system is well-positioned to support high transaction volumes while maintaining performance, security, and user satisfaction.
